

## ANTHROPOMETRIC STUDIO

### PROGRAMME AND CONCEPT

In the Anthropometry exercise we measured all the basic dimensions of a human body and the space required to do basic activities of daily routine. Then we measure drew the tea stall in vendor exercise which made us visualize the space required by a human to move around and do the activity. Under space making activity we were told to design a house for ourself which may not have specific shape, so we designed a house with minimum space and maximum utility in which a person can live comfortably. After learning all the basic dimensions of anthropometry, we were given an existing site with two trees placed there and we need to design a cafe having levels which can have maximum height of 1.5m. In that I designed a cafe where in my all the levels are above ground level, so the person entering the cafe can have the entire view of cafe. The toilet block and the serving block are kept at the entry so that they do not hamper the entire look of the cafe. I used the existing tree in the site as an attractive element with a table around it. I have also kept different levels for different number of people coming which can further lead to a private floor given for a party or something. Hence the studio was an amazing and knowledgeable journey which broadened our vision.
